

## Modules

Command	Structure	Example	Obs
Define Function	<code>def [name of function] ( [variable1] , [variable2] ):</code>		define uma <b>função</b>
	<code>def [name of function] ( [variable1] , [variable2] = [defaultValue] ):</code>		define uma <b>valor padrão</b> para um <b>argumento</b>
	<code>def [name of function] ( [variable1] , [variable2] ):</code> <code>    return [variable]</code>		
	<code>def [name of function] ( [variable1] , [variable2] ):</code> <code>    return [variableA] , [variableB]</code>	<code>def quadrados (valorA , valorB):</code> <code>    return valorA**2 , valorB**2</code> <code>quadA, quadB = quadrados(2,3)</code>	<b>multiplos retornos</b>
Import	<code>import [module]</code>	<code>import math</code>	Importa todo o modulo
	<code>print [module].[function] ( [variable] )</code>	<code>print math.sqrt(25)</code>	
	<code>print dir ( [module] )</code>	<code>print( dir(math) )</code>	Mostra todas as funções do modulo
From / Import	<code>from [module] import [function]</code>	<code>from math import sqrt</code>	Importa uma função do modulo
	<code>print [function] ( [variable] )</code>	<code>print sqrt(25)</code>	
	<code>from [module] import *</code>	<code>from math import *</code>	Todas as funções do modulo

## Functions

Command	Structure	Example	Obs
Type	<code>type( [data] )</code>	<code>print( type(2,3) )</code>	Mostra tipo primitivo
Range	<code>range( [stop] )</code>	<code>range(4)</code>	0,1,2,3
	<code>range( [start] , [stop] )</code>	<code>range(2, 6)</code>	2,3,4,5
	<code>range( [start] , [stop] , [step] )</code>	<code>range(3, 10, 2)</code>	3,5,7,9
Help	<code>help( [objeto] )</code>		Exibe informações sobre o objeto
Int	<code>int( [data] , [base which num is] )</code>	<code>int ("0b100",2)</code>	Transformar em int
Float	<code>float( [data] )</code>		Transformar em float
Str	<code>str( [data] )</code>		Transformar em string
Lambda	<code>nomeFuncao = lambda [variable1] , [variable2] :</code> <code>[returnedValue]</code>	<code>funcao = lambda numA, numB : numA + numB</code> <code>funcao(2, 3)</code>	Cria uma função descartável
	<code>filter ( lambda [variable] : [what will be returned] ,</code> <code>[where is applied the filter] )</code>	<code>print( filter ( lambda x: x%3==0, my_list) )</code>	Filtrar os elementos de uma lista onde lambda retorna True
	<code>map ( lambda [variable] : [what will be returned] ,</code> <code>[where is applied the filter] )</code>	<code>print( map ( lambda x: x**2, my_list) )</code>	Realiza uma operação com cada elemento de uma lista
	<code>reduce</code>		Retorna um unico elemento de uma lista realizando um calculo n vezes

## List of Modules

Command	Structure	Example
Datetime	<code>import datetime</code>	<code>from datetime import datetime</code>
Math	<code>import math</code>	<code>from math import sqrt , factorial</code>
Random	<code>import random</code>	<code>from random import randint , uniform</code>
